SUMMARY

Junior aerospace engineering student with leadership experience in team-based, results-oriented projects including work in hardware-software interfacing, specification development, computer-aided modeling, and systems integration. Interests include control theory, signal processing, avionics, and propulsion. Open to relocation.

EDUCATION

B.S.E, Aerospace Engineering; Autonomous Vehicle Systems — Graduating May 2022
Arizona State University, Tempe, AZ — 4.00 GPA
Barrett, The Honors College

TECHNICAL SKILLS

Presentation and Organization: Microsoft Office, LaTeX
Design and Modeling: MATLAB, SOLIDWORKS, LabVIEW
Programming: Python, C/C++, Linux (git, vim, gcc), R

EXPERIENCE

Liquid Propulsion Avionics Lead, Sun Devil Rocketry — August 2019-Present

- Leading efforts on the development of an avionics system for a liquid bi-propellant engine with over twenty hardware components including valves, sensors, and controllers
- Interfacing temperature, pressure, thrust, and flow measurements with a custom Python program
- Conducting trade studies on electronic actuators and orifice flow meters to develop specification requirements using MATLAB for multivariate trade-off analyses and physical modeling
- Built a signal amplifier to boost sensor outputs to measurable ranges resulting in savings upwards of $200
- Reported project progress in published AIAA Propulsion and Energy conference paper
- Wrote a development plan for the 2020-2021 academic year consisting of 42 deliverables to cultivate a results-oriented work environment and to delegate workloads among new talent

5280 Team Member, Sun Devil Rocketry — Fall 2018-Spring 2019

- Collaborated with a group of 12 students to launch an amateur rocket to an altitude of 5280 feet
- Determined build specifications, apogee altitude, and static margin with OpenRocket software
- Constructed rocket with phenolic tubing wrapped with epoxied fiberglass fabric and laser-cut fins
- Pragmatically adjusted final build to mitigate static margin error, allowing rocket to be launched on time
- Used a microcontroller breakout board with internal altimeter for parachute deployment

ACADEMIC PROJECTS

Team Lead, Airfoil Statistics Project — Spring 2020

- Lead a group of seven students to complete a semester long project by devising a project plan, delegating workloads, setting timelines, and scheduling team meetings
- Collected computational aerodynamic data with Ansys for airflow over a wing section with configurable design specifications created with SOLIDWORKS from a NACA 2412 airfoil parameterization
- Used the R language to analyze data with an Analysis of Variance test and to compute significance-based regression models for wing section lift and drag response to chord length, angle of attack, and sweep angle

Honors Student, Trans-lunar Injection Simulation — Spring 2019

- Simulated a free-return, trans-lunar injection orbital trajectory in MATLAB with an animated solution
- Calculated the trajectory by solving the two-body problem using a numerical differential equation solver built from scratch with Apollo 11 low earth orbit initial conditions
